EXECUTIVE SUMMARY:

1. **Problem Statement:**
   When a suitable host is unavailable, Hopr users currently have no way to discover and coordinate with other guests travelling along the same route and time. As a result, users may be unable to find a viable shared-ride option within Hopr and may have to arrange transportation independently.

2. **Goals and my Non-Goals:**
   - **GOALS-**
     i.Enable guest riders traveling on the same route within a similar time window to connect with one another in the unavailability of a suitable host.
     ii. Enable the connected group to book a shared cab/auto through Rapido..
     iii. Display each rider's estimated share of the total fare within the Hopr app..
   - **NON-GOALS-**
     i.Focusing on more precise and accurate route navigation.
     ii. Enabling payments for the ride directly within the Hopr app.
     iii. Integrating co-passenger rating within the same app.
3. **Success Metric:**
   - **NORTH STAR METRIC-** Average number of rides completed per active user per week.
   - **L1- i.** Feature adoption rate- #active users who use the guest-matching feature
     ii. Guest to ride conversion rate
   - **COUNTER- i.** Guest drop off rate- %users who leave the matching or booking flow before completing it.
     ii. Ride cancellation rate- %initiated bookings- cancelled.

4. **User Journey:**

5. **User Empathy:**

6. **Competitor Analysis:**

i. Smart Guest Matching: Enable guests travelling along compatible routes and within similar time windows to discover and connect with one another when no suitable host is available.

ii. Verified Co-rider Profiles: Build user confidence by displaying relevant profile information before the group confirms its travel plans.

iii. Rapido Fallback and Fare Transparency: Enable unmatched guests to proceed to Rapido for shared transportation options while viewing an estimated per-person fare within Hopr, where feasible.

RICE Prioritization:

Opportunity	Reach	Impact	Confidence	Effort	Priority
Smart Guest Matching	High	High	Medium	Medium	P0
Verified Co-rider Profiles	Medium	HIgh	High	Low	P1
Rapido Fallback and Fare Transparency	Medium	High	Medium	High	P2

7. **FUNCTIONAL AND ACCEPTANCE CRITERIA:**
   i. Functional- The system shall allow guest-to-guest matching when no suitable host is available, and after a successful match the system shall allow the users to proceed to rapido where the relevant journey details would already be passed.
   ii. Non Functional:
   a. P- Performance: System should display compatible guest matches within 5 seconds under normal operating conditions.
   b. Q - Quality: The suggested matches should satisfy the defined route, departure time, and group capacity criteria.
   c. R - Reliability: The guest-matching service should maintain an availability of at least 99%.
   d. S- Security: Encryptions and user controls should be designed such that user profile and journey details are secure.
   e. T- Testability: The system should enable testing of matching logic, group formation, cancellation, and failed match scenarios against defined acceptance criteria.
   f. U- Usability: Users should be able to understand the logic of matches, accepting and declining a match, and identify subsequent steps without confusion.

8. **Prototype:** hopr
